Consortium/LLNL at: http://image.llnl.gov Series: IRAK Plate: 69 Row: p Column: 22
This clone was selected for full length sequencing because it passed the following selection criteria: matched mRNA g1: 15718718.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                         US-10-090-035-3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 5, Application US/08044618
Patent No. 5449605
GENERAL INFORMATION:
APPLICANT: SMULSON, MARK
TITLE OF INVENTION: CANCER BY THE USED OF RESTRICTION TO
TITLE OF INVENTION: POLYMORPHISM OF THE GENE FOR THE HUMAN POLY (ADP-RIBOSE)
TITLE OF INVENTION: POLYMORPHISM OF THE GENE FOR THE HUMAN POLY (ADP-RIBOSE)
NUMBER OF SEQUENCES: 7
CORRESPONDENCE ADDRESS:
ADDRESSEE: Sterne, Kessler, Goldstein & Fox
APPLICAMT: Feder, Joun N.
APPLICAMT: Kronmal, Gregory S.
APPLICAMT: Lauer, Peter M.
APPLICAMT: Lauer, Peter M.
APPLICAMT: Lauer, Peter M.
APPLICAMT: Thomas, Winston
APPLICAMT: Wolff, Reger K.
TITLE OF INVENTION: Sequences and Antibodies Thereto
APPLICAMT: Wolff, Reger K.
APPLICAMT: Wolff, Reger K.
APPLICAMT: Wolff, Reger K.
APPLICAMT: Wolf, Winston
APPLICAMT: Wolf, Winston
APPLICAMT: Wolf, Winston

The present sequence encodes one of 32 novel human secreted polypeptides.

The nucleic acid molecules and polypeptides they encode may be used in the nucleic acid molecules and polypeptides they encode may be used in the prevention, diagnosis and treatment of diseases such as immuno-deficiency virus (HIV) infections), hyperproliferative disorders (e.g. cancers and Gaucher's disease), cardiovascular diseases of Schmitter syndrome, Chaga's cardiomyopathy and coronary (e.g. Schmitter syndrome, Chaga's cardiomyopathy and coronary arteriosclerosis), angiogenic disorders (e.g. corneal graft neovascularisation and diabetic retinopathy), neurological disorders (e.g. thurington's chorea, Alzheimer's disease and Parkinson's disease), infectious diseases and/or for promoting wound healing, regeneration and/or chemotaxis. The nucleic acid molecules may be used to produce the secreted polypeptides. They may also be used as DNA probes in diagnostic secreted polypeptides. They may also be used as DNA probes in diagnostic secreted polypeptides may be used as antigens in the capture of antibodies and in assays to identify modulators of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Rat sequence differentially expressed in response to a hepatotoxin #508.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Rat; ss; hepatotoxin; expressed sequence tag; EST; drug screening; differential expression; centrilobular necrosis; steatosis.
                                       Nucleic acids encoding 32 human secreted polypeptides, useful for preventing, diagnosing and/or treating e.g. cancers, Parkinson's disease and diabetic retinopathy

The invention relates to methods for predicting toxic effects of compounds or the progression of these toxic effects by determining the compounds or the progression in tissues or cells exposed to the global changes in gene expression in unexposed tissues or toxic toxin and comparing these to gene expression in unexposed tissues or calls. Also included are methods of predicting at least one toxic effect of a compound or progression of a toxic effect, preferably the heaptcotxicity of a compound, comprising detecting the level of heaptcotxicity of a compound comprising detecting the level of expression in a tissue or cell sample exposed to the compound of two or compression in a tissue or cell sample exposed to the compound of two or more genes listed in the specification, where differential expression of the method can also be used to identify an agent which modulates the coxic response and predict cellular pathways that a compound modulates to the method utilises a set of at least two probes (on a solid or support in kit form), where each of the probes comprises a sequence that support in kit form), where each of the probes comprises a sequence that system comprising a database containing information identifying the expression level in a tissue or cell sample exposed to a hepatotoxin of a capical in the specification. The method is useful for elucidating quobal containing information used to present information used to relate a prediction or identifying the expression and for identifying to a known toxin. The genes may be used as tissues or cell exposed to a known toxin. The genes may be used as containing an expression information may be used as diagnostic markers in capical public markers in a gene expression in the special containing and order the appearance of the physiological state of tissue or cell expression information may be used as diagnostic markers or the propession or identification or identification as defined a gene expressed sequence tas expressed sequence tas equence tas gene expressed sequence predicting toxic effects of compounds or the progression of these toxic effects by determining the changes in gene expression in tissues or cells exposed to the toxin and comparing these to gene expression in Sequence 569 BP; 132 A; 98 C; 117 G; 222 T; 0 other; Claim 1; Seq ID No 508; 239pp; English. unexposed tissues or cells -WPI; 2002-241625/29.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  4-SEP-2
                                                                                                                                                                                                                                                                                                                                                                                                        AMEB1787 to AAFB1817 encode the human secreted proteins given in AAB74733 to AAB74772. Human secreted proteins can have activities based on the tissues and cells they are expressed in. Example of activities include: CC tissues and cells they are expressed in. Example of activities include: antiinflammatory; antisclerotic; dermatological; immunosuppressive; vascular; anti-anglogenic; ophthalmological; neuroprotectant; noctropic; vascular; anti-anglogenic; ophthalmological; neuroprotectant; noctropic; canticonvulsant; antialzelmers; antiparkinsonlan; antimicrobial; and vaccine. Human secreted proteins can be used in quene therapy and conversed with inappropriate polypeptide expression. For example, NAM1 associated with inappropriate polypeptide expression for example, NAM1 cand PEP1 may be used to treat disorders associated with decreased conversed with appropriate polypeptide expression for example, NAM1 cand affect the activity of proteins by expressing inactive proteins or that affect the activity of proteins by expressing inactive proteins or consupplement the patients own production of polypeptides. Disorders, hyperproliferative disorders (e.g. cancers), candiovascular diseases and/or conformation and inactive production of conformations and conformation and invantances in the exemplification of the necessity invantion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; immune; haematopoietic; immune/haematopoietic antigen; cancer;

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

C amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)

C activity, and can be used in gene therapy and vaccine production. (I)

C proteins and polynucleotides may be used in the prevention, diagnosis and

C treatment of diseases associated with inappropriate (I) expression. For

example, they may be used to treat disorders associated with decreased

C expression by rectifying mutations or deletions in a patient's genome

CC that affect the activity of (I) by expressing inactive proteins or to

c supplement the patients own production of (I). Additionally, (I)

C supplement the patients own production of (I). Additionally, (I)

CC polynucleotides may be used to produce the secreted (I), by inserting

CC the nucleic acids into a host cell and culturing the cell to express the

protein. (I) proteins and polynucleotides may be used to prevent,

diagnose and treat immune/haematopoietic-derived cells: AAK64703

CC cancers and cancer metastases of haematopoietic-derived cells: AAK64703

CC cancers and cancer metastases of haematopoietic-derived cells: AAK64703

CC CARRORS from the present invention. AAK54912 to AAK64950 and AAM82169

C represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, cytokine, cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation; ss.
Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

         The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or e.g. stem cell growth factor activity, memalopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                          Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; secreted protein; gene therapy; protein therapy; cancer; weight; tumour; chromosome mapping; forensic; haematological disease; allergy; inflammation; cell proliferation; viral infection; wound healing; modulation; appetite; behaviour; food additive; preservative; ss.

The invention relates to nucleic acid sequences (AAX22211 to AAX22283) encoding human secreted proteins (AAY0183 to AAY01454). The secreted proteins (AAY0183 to AAY01454). The secreted control gene sequences are deposited with the ATCC under deposit number ATCC 209188, 209139 or 209114. Host cells contraining vectors comprising the nucleic acid sequences are used for the recombinant expression of useful for preventing, treating or amelorating medical conditions are 9.9 protein or gene therapy. Pathological conditions can be also diagnosed by determining the amount of the new polypeptides in a sample or by the sequences, or its fragments are useful for chromosome identification conditions the amount of the new polypeptides. The nucleic acid sequences, or its fragments are useful for chromosome identification therapy; for (forensic) identification of individuals; as molecular contexpy; for (forensic) identification of individuals; as molecular weight markers; to identify related sequences or specific mRNM; in the repetutioally to inhibit or activate particular polypeptides are therapeutically to inhibit or activate particular polypeptides and useful as immunoassay reagents (including for in vivo inaging) and wide range of disorders may be treated with the polynucleotide and contexperite infermitation, cancer or other forms of cell proliferation, viral contexperite, behaviour etc. and as food additive or preservative. The condulate differentiation of embryonic stem cells, to modulate wight, appetite, behaviour etc. and as food additive or preservative. The present sequence represents a gene encoding a human secreted protein axxx
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; ovarian antigen; ovary; ovarian; breast; cancer; tumour; ovarian cancer; breast cancer; tumour; reproductive system disorder; infertility; pregnancy disorder; anovulation; polycystic ovary syndrome; pCOS; ovarian cyst; dysmenorrhoea; endocrine disorder; infection; inflammatory condition; immune disorder; blood disorder; acadiovascoular disorder; respiratory disorder; neurological disorder; gastrolntestinal disorder; urinary system disorder; drug screening; gene therapy; chromosome mapping; forensic analysis; antibody preparation; cytostatic; immunomodulatory; neuroprotective; antilnflammatory; gynaecological; reproductive; chromosome 3q21-25;

The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful immunosuppressant and cytostatic activity. The polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system incompating and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activinhinhian activity, chemokinetic activity, haemostatic and thrombolytic activity, cencer diagnosis and therapy, drug screening,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence data for this patent did not form part of the printed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to 2175 novel human ovarian antigens (ABP41054-CC ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also cnompasses polypeptides 90% identical and polynucleotides 95% identical cc to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polynucleotides and polypeptides in diagnosing, crecombinant vectors and host cells comprising human ovarian antigen of ovarian antigen polynucleotides and polypeptides in diagnosing, creating, prognosing or preventing various ovary and/or breast cancer, and disorders. Such conditions include ovarian cancer and breast cancer, and clasorders (e.g., infertility, disorders of pregnancy, anovulation, disorders, infertilored, ovarian cysts, and dysmenorrhoea), endocrine clasorders, infections (e.g., chlamydia, HTV, toxoplasmosis, and toxic shock syndrome, inflammatory conditions (e.g., mastitis, cophoritis and vaginitis), immune disorders (e.g., congenital and acquired toxoplasmosis, and toxic compoundeficiencies, autoimmune cophoritis, systemic lupus erythematosus), immunodeficiencies, autoimmune cophoritis, systemic lupus erythematosus, immunodeficiencies, autoimmune ophoritis, systemic lupus erythematosus, complantate ovarian disorders, neurological disorders, gastrointestinal disorders and urinary system disorders, ovarian antigen polypeptides and modulate ovarian antigen expression or activity. The polynucleotides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polynucleotides may be used as food additives or to prepare antibodies (consequence represents cDNA encoding a human ovarian antigen of the functions of individuals and in disease diagnosis, drug targeting and phenotyping. The present sequence represents cDNA encoding a human ovarian antigen of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological diseases

Zhao QA,
                                                                                                                                                                                                                                                                                                                                                                                     Tang YT,
             The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and etreatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                           Human: cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorder; arthritis; inflammation; ss.
                                                                                                                                                                                                                                                                                                                                                                           Ma Y;

```
The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAAM3642-AAM42213) with nootropic, the encoded polypeptides (AAAM3642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypuclectides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat disease of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system classed neuropathies and central nervous system disease, such as lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, and thrombolytic activity, chemotactic/chemokinetic activity, haemostatic assays for receptor activity, arthritis and inflammation, leukaemias and constants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Note: The sequence data for this patent did not form part of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0;.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, Alzheimer's disease, Alzheimer's disease, prof. epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA repair; cytosine methylation; PMS2L1; PMS2L12; PMS2L2; PMS2L3; PMS2, L4; PMS2L5; PMS2L6; MGMT; MSH2; NUDT1; TDG; INPPL1; RFC4; DDIT1L; FANCB; XRCC8; ataxia telangiectasia; aging; Bloom's syndrome; Cockayne syndrome; Nijmegen breakage syndrome; Werner syndrome; immunodeficiency; trichthiodystrophy; Fanconi's anaemia; solid tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid comprising fragment of chemically modified gene, useful for diagnosis and treatment of diseases associated with abnormal cytosine methylation
antiinflammatory; cancer; eye disease; arteriosclerosis; anaemia; acute myeloid leukaemia; Alzheimer's disease; AIDS; epilepsy; neurofibromatosis; rheumatoid arthritis; psoriasis; bowel disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chemically treated DNA repair gene fragment complementary to#57.

variants of proteins related to amylases, amyloid proteins, angiopoietin, approsis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, Kinases, Colony stimulating factors, complement related proteins, cytochromes, kinesels, cytochromes, kinesterases. The present sequence is proteins, cytochromes, kinesterases. The present sequence is one such oligonucleotide. The oligonucleotides and the peptides encoded by the mm may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune systemic lupus erythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, cancer continued the continued of the protein of pathogenic
                                                                                                                                                                                                                                                                                                                                                         Polymorphic nucleic acids encoding e.g. amylases, cyclins, polymerases, oncogenes and histones, useful for diagnosing and treating, e.g. cancer, autoimmune diseases and infections –
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to oligonucleotides encoding polymorphic

cancer associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene cancer antigens have cytostatic activity and can be used in gene diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing lanctive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inscrting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAH37199 represent sequences used in the exemplification of the Nucleic acids encoding 4277 human colon cancer-associated polypeptides, useful for preventing, diagnosing and/or treating colorectal cancers -M.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027 to 1052, 7921 and 7922. AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon Claim 1; Page 2294; 9803pp; English

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
